

Controlled CG chain certificate

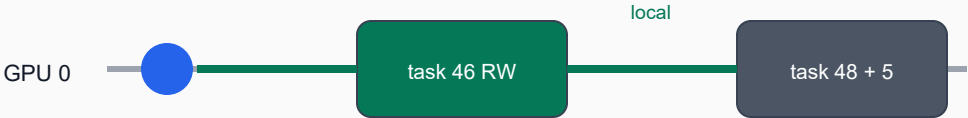

One direct placement intervention; trace-on mechanism evidence, not performance evidence

A. HEFT: migrate, then return

Target peer traffic
7 events / 939,524,096 B
1 migration + 6 fixed-device returns

B. Fixed-successor SALC

One-hop certificate
6.483948 - 0.474260 = +6.009688 ms
avoided return lower bound - current EFT damage

Observed outcome
0 target peer bytes
1 direct + 27 downstream placement differences

Qualified scope
Controlled mechanism only; correctness PASS. Runtime attribution is a conditional task/data/fixed-successor join; latency is ineligible.
